Overview

- Introduction
- Methods
- Results
- Summary

Introduction: Our objective

- Determining the brain disconnection due to a lesion.
- Predicting the behaviour due to the disconnection.

Methods: Our approach

- We partition the brain into nodes.
- At any node, we study the:
 - Direct damage.
 - Indirect damage.

Methods: Direct damage

0 % damage

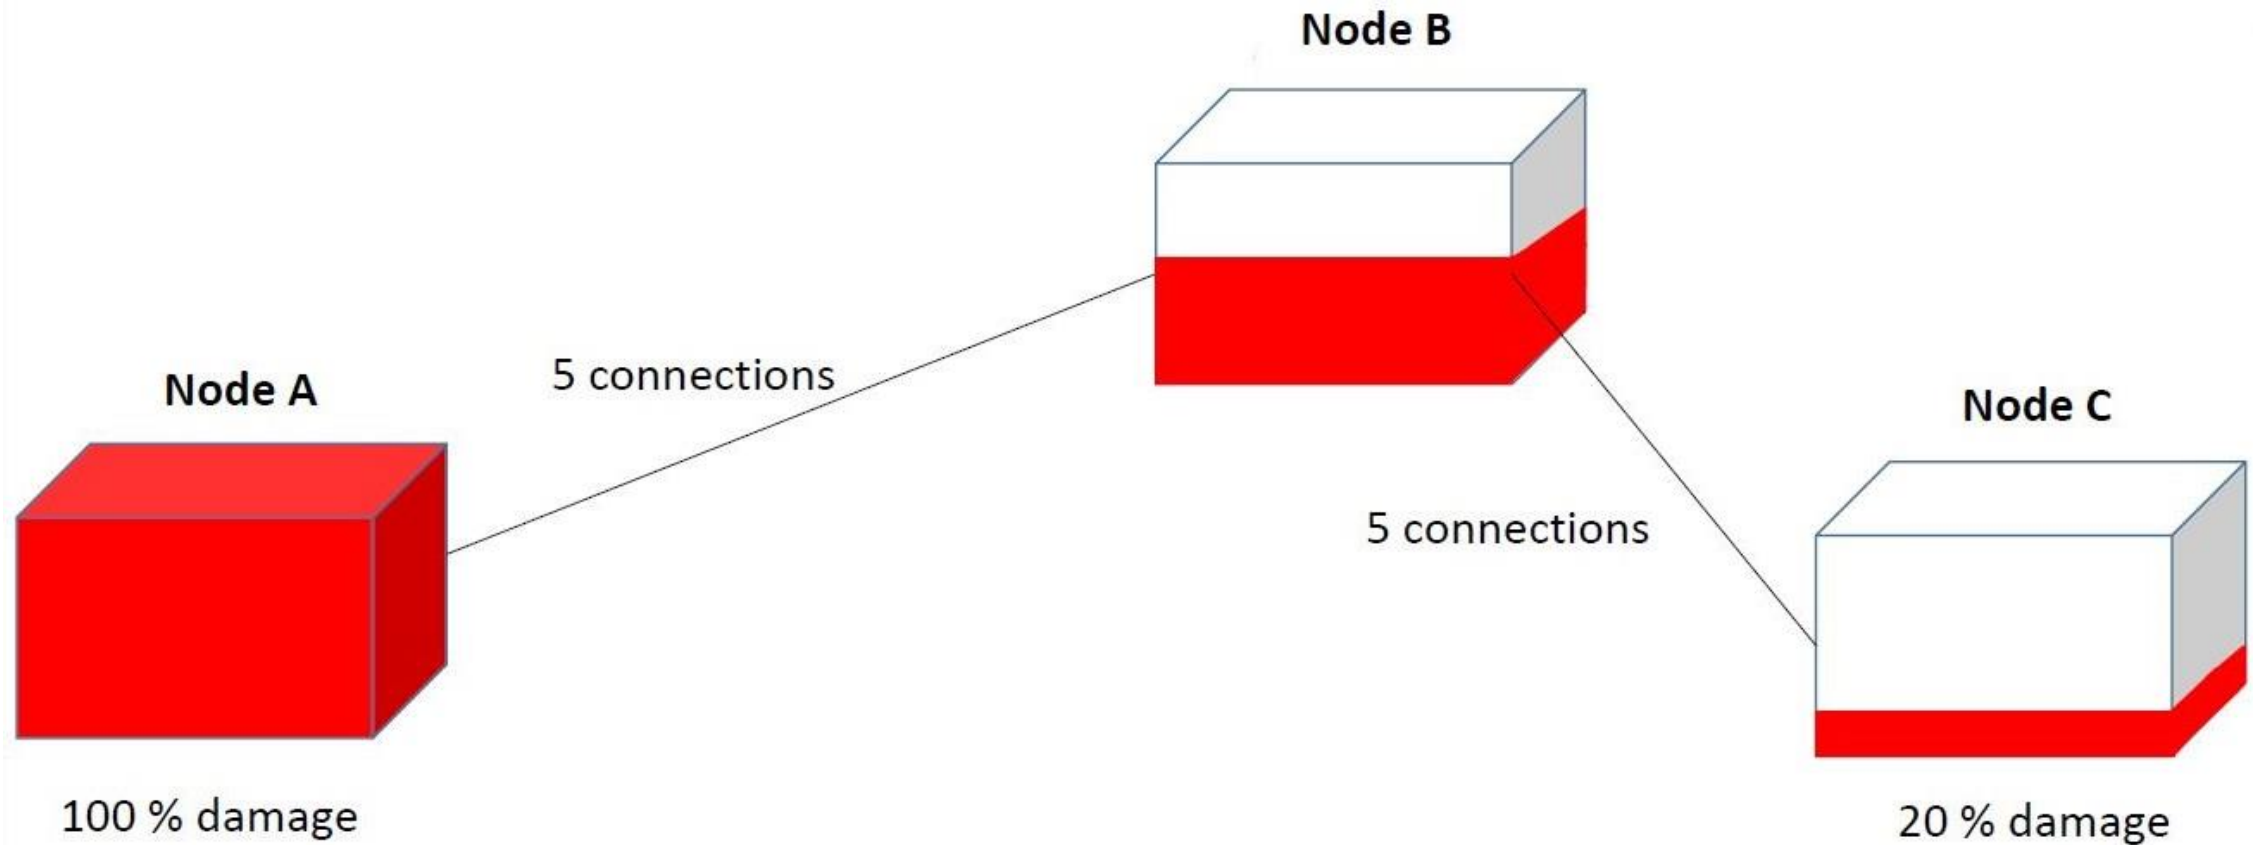

70 % damage

100 % damage

Methods: Indirect damage

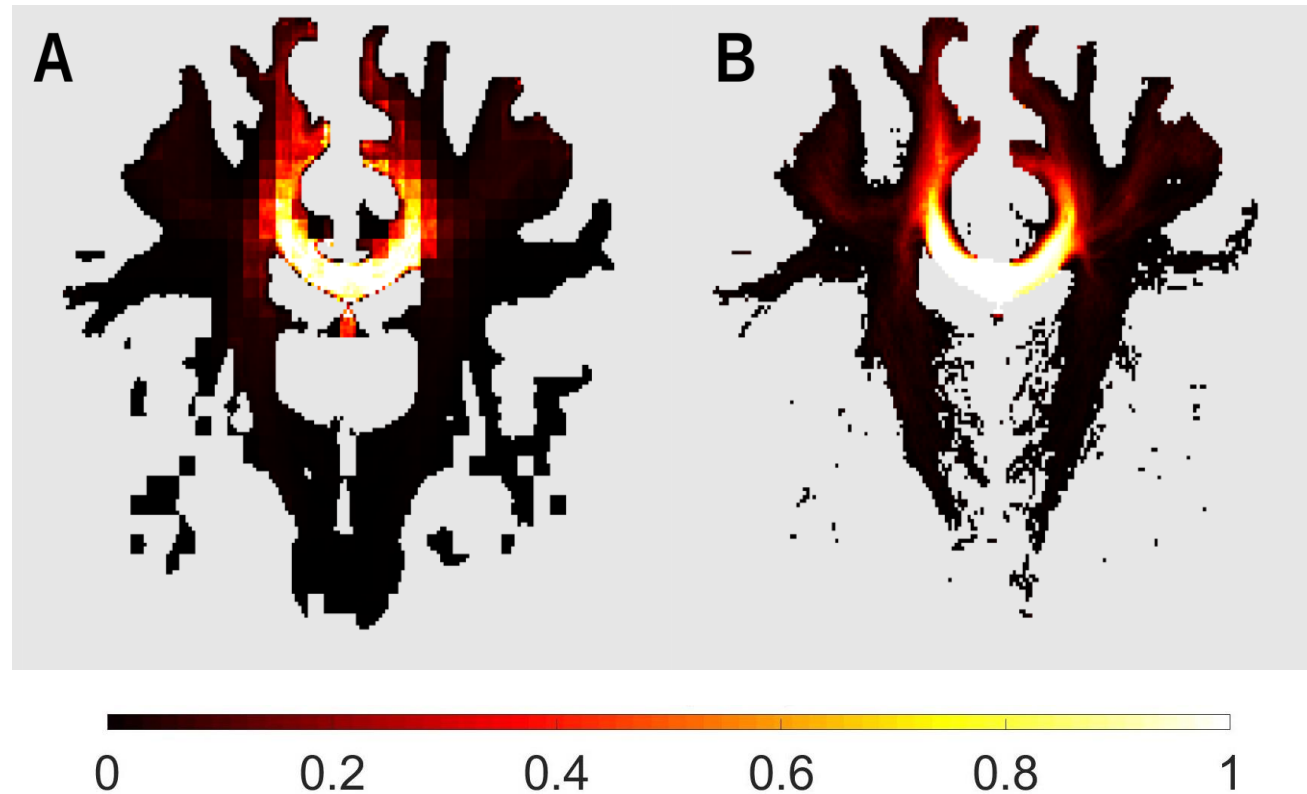

Results: Simulated data preliminary results

Results: Simulated data

- A comparison between our method (A) and Mrtrix3 (B).

Results: Real data

- A comparison between our method (A) and Mrtrix3 (B).

Summary

- We present a rapid and practical method for quantifying the impact of white matter disconnection.
 - Our method is more than 9 times faster than MRtrix3
 - Our method gives very similar spatial pattern of results
- This is the first step towards rapid quantification of network disconnections for clinical application.
